CHAPTER J
DESIGN OF CONNECTIONS

This chapter addresses connecting elements, connectors and the affected elements of connected members not subject to fatigue loads.

The chapter is organized as follows:

- J2. Welds
- J3. Bolts and Threaded Parts
- J4. Affected Elements of Members and Connecting Elements
- J5. Fillers
- J6. Splices
- J7. Bearing Strength
- J8. Column Bases and Bearing on Concrete
- J9. Anchor Rods and Embedments
- J10. Flanges and Webs with Concentrated Forces

User Note: For cases not included in this chapter, the following sections apply:

- Chapter K Design of HSS and Box Member Connections
- Appendix 3 Design for Fatigue

J1. GENERAL PROVISIONS

1. Design Basis

The design strength, \( \phi R_n \), and the allowable strength \( R_n/\Omega \), of connections shall be determined in accordance with the provisions of this chapter and the provisions of Chapter B.

The required strength of the connections shall be determined by structural analysis for the specified design loads, consistent with the type of construction specified, or shall be a proportion of the required strength of the connected members when so specified herein.

Where the gravity axes of intersecting axially loaded members do not intersect at one point, the effects of eccentricity shall be considered.

2. Simple Connections

Simple connections of beams, girders and trusses shall be designed as flexible and are permitted to be proportioned for the reaction shears only, except as otherwise indicated in the design documents. Flexible beam connections shall accommodate end rotations of simple beams. Some inelastic but self-limiting deformation in the connection is permitted to accommodate the end rotation of a simple beam.

3. Moment Connections

End connections of restrained beams, girders and trusses shall be designed for the combined effect of forces resulting from moment and shear induced by the rigidity of the connections. Response criteria for moment connections are provided in Section B3.6b.

User Note: See Chapter C and Appendix 7 for analysis requirements to establish the required strength for the design of connections.

4. Compression Members With Bearing Joints

Compression members relying on bearing for load transfer shall meet the following requirements:

1. When columns bear on bearing plates or are finished to bear at splices, there shall be sufficient connectors to hold all parts securely in place.
2. When compression members other than columns are finished to bear, the splice material and its connectors shall be arranged to hold all parts in line and their required strength shall be the lesser of:
   (i) An axial tensile force of 50% of the required compressive strength of the member; or
   (ii) The moment and shear resulting from a transverse load equal to 2% of the required compressive strength of the member. The transverse load shall be applied at the location of the splice exclusive of other loads that act on the member. The member shall be taken as pinned for the determination of the shears and moments at the splice.

User Note: All compression joints should also be proportioned to resist any tension developed by the load combinations stipulated in Section B2.

5. Splices in Heavy Sections

When tensile forces due to applied tension or flexure are to be transmitted through splices in heavy sections, as defined in Sections A3.1c and A3.1d, by complete-joint-penetration groove (CJP) welds, the following provisions apply: (1) material notch-toughness requirements as given in Sections A3.1c and A3.1d; (2) weld access hole details as given in Section J1.6; (3) filler metal requirements as given in Section J2.6; and (4) thermal cut surface preparation and inspection requirements as given in Section M2.2. The foregoing provision is not applicable to splices of elements of built-up shapes that are welded prior to assembling the shape.

User Note: CJP groove welded splices of heavy sections can exhibit detrimental effects of weld shrinkage. Members that are sized for compression that are also subject to tensile forces may be less susceptible to damage from shrinkage if they are spliced using partial-joint-penetration PJG groove welds on the flanges and fillet-welded web plates, or using bolts for some or all of the splice.
6. **Weld Access Holes**

   All weld access holes required to facilitate welding operations shall be detailed to provide room for weld backing as needed. The access hole shall have a length from the toe of the weld preparation not less than 1 1/2 times the thickness of the material in which the hole is made, nor less than 1 1/2 in. (38 mm). The access hole shall have a height not less than the thickness of the material with the access hole, nor less than 3/4 in. (19 mm), nor does it need to exceed 2 in. (50 mm).

   For sections that are rolled or welded prior to cutting, the edge of the web shall be sloped or curved from the surface of the flange to the reentrant surface of the access hole. In hot-rolled shapes, and built-up shapes with CJP groove welds that join the web-to-flange, weld access holes shall be free of notches and sharp reentrant corners. No arc of the weld access hole shall have a radius less than 1/4 in. (10 mm).

   In built-up shapes with fillet or partial-joint-penetration groove welds that join the web-to-flange, weld access holes shall be free of notches and sharp reentrant corners. The access hole shall be permitted to terminate perpendicular to the flange, providing the weld is terminated at least a distance equal to the weld size away from the access hole.

   For heavy sections as defined in Sections A3.1c and A3.1d, the thermally cut surfaces of weld access holes shall be ground to bright metal and inspected by either magnetic particle or dye penetrant methods prior to deposition of splice welds. If the curved transition portion of weld access holes is formed by predrilled or sawed holes, that portion of the access hole need not be ground. Weld access holes in other shapes need not be ground nor inspected by dye penetrant or magnetic particle methods.

7. **Placement of Welds and Bolts**

   Groups of welds or bolts at the ends of any member which transmit axial force into that member shall be sized so that the center of gravity of the group coincides with the center of gravity of the member, unless provision is made for the eccentricity. The foregoing provision is not applicable to end connections of single angle, double angle and similar members.

8. **Bolts in Combination With Welds**

   Bolts shall not be considered as sharing the load in combination with welds, except that shear connections with any grade of bolts permitted by Section A3.3, installed in standard holes or short slots transverse to the direction of the load, are permitted to be considered to share the load with longitudinally loaded fillet welds. In such connections the available strength of the bolts shall not be taken as greater than 50% of the available strength of bearing-type bolts in the connection.

   In making welded alterations to structures, existing rivets and high-strength bolts tightened to the requirements for slip-critical connections are permitted to be utilized for carrying loads present at the time of alteration and the welding need only provide the additional required strength.

9. **High-Strength Bolts in Combination With Rivets**

   In both new work and alterations, in connections designed as slip-critical connections in accordance with the provisions of Section J3, high-strength bolts are permitted to be considered as sharing the load with existing rivets.

10. **Limitations on Bolted and Welded Connections**

   Joints with pretensioned bolts or welds shall be used for the following connections:

   (1) Column splices in all multi-story structures over 125 ft (38 m) in height
   (2) Connections of all beams and girders to columns and any other beams and girders on which the bracing of columns is dependent in structures over 125 ft (38 m) in height
   (3) In all structures carrying cranes of over 5 ton (50 kN) capacity: roof truss splices and connections of trusses to columns; column splices; column bracing; knee braces; and crane supports
   (4) Connections for the support of machinery and other live loads that produce impact or reversal of load

   Snug-tightened joints or joints with ASTM A307 bolts shall be permitted except where otherwise specified.

J2. **WELDS**

   All provisions of AWS D1.1/D1.1M apply under this Specification, with the exception that the provisions of the listed AISC Specification Sections apply under this Specification in lieu of the cited AWS provisions as follows:

   (1) Section J1.6 in lieu of AWS D1.1/D1.1M, Section 5.17.1
   (2) Section J2.2a in lieu of AWS D1.1/D1.1M, Section 2.3.2
   (3) Table J2.2 in lieu of AWS D1.1/D1.1M, Table 2.1
   (4) Table J2.5 in lieu of AWS D1.1/D1.1M, Table 2.3
   (5) Appendix 3, Table A-3.1 in lieu of AWS D1.1/D1.1M, Table 2.5
   (6) Section B3.11 and Appendix 3 in lieu of AWS D1.1/D1.1M, Section 2, Part C
   (7) Section M2.2 in lieu of AWS D1.1/D1.1M, Sections 5.15.4.3 and 5.15.4.4

1. **Groove Welds**

   1a. **Effective Area**

      The effective area of groove welds shall be considered as the length of the weld times the effective throat.

      The effective throat of a complete-joint-penetration (CJP) groove weld shall be the thickness of the thinner part joined.

      The effective throat of a partial-joint-penetration (PJP) groove weld shall be as shown in Table J2.1.
**TABLE J2.1**

</tbody>
</table>

**User Note:** The effective throat of a partial-joint-penetration groove weld is dependent on the process used and the weld position. The design drawings should either indicate the effective throat required or the weld strength required, and the fabricator should detail the joint based on the weld process and position to be used to weld the joint.

The effective weld throat for flare groove welds when filled flush to the surface of a round bar or a 90° bend in a formed section or rectangular HSS, shall be as shown in Table J2.2, unless other effective throats are demonstrated by tests. The effective throat of flare groove welds filled less than flush shall be as shown in Table J2.2, less the greatest perpendicular dimension measured from a line flush to the base metal surface to the weld surface.

Larger effective throats than those in Table J2.2 are permitted for a given welding procedure specification (WPS), provided the fabricator can establish by qualification the consistent production of such larger effective throat. Qualification shall consist of sectioning the weld normal to its axis, at mid-length and terminal ends. Such sectioning shall be made on a number of combinations of material sizes representative of the range to be used in the fabrication.

[a] See Table J2.1

1b. Limitations

The minimum effective throat of a partial-joint-penetration groove weld shall not be less than the size required to transmit calculated forces nor the size shown in Table J2.3. Minimum weld size is determined by the thinner of the two parts joined.

2. Fillet Welds

2a. Effective Area

The effective area of a fillet weld shall be the effective length multiplied by the effective throat. The effective throat of a fillet weld shall be the shortest distance from the root to the face of the diagrammatic weld. An increase in effective throat...

</tbody>
</table>

[d] Leg dimension of fillet welds. Single pass welds must be used.
Note: See Section J2.2b for maximum size of fillet welds.

For end-loaded fillet welds with a length up to 100 times the weld size, it is permitted to take the effective length equal to the actual length. When the length of the end-loaded fillet weld exceeds 100 times the weld size, the effective length shall be determined by multiplying the actual length by the reduction factor, \( \beta \), determined as follows:

\[
\beta = 1.2 - 0.002(l/w) \leq 1.0 \quad (J2-1)
\]

where

- \( l \) = actual length of end-loaded weld, in. (mm)
- \( w \) = size of weld leg, in. (mm)

When the length of the weld exceeds 300 times the leg size, the effective length shall be taken as 180\( \text{°} \).

Intermittent fillet welds are permitted to be used to transfer calculated stress across a joint or faying surfaces and to join components of built-up members. The length of any segment of intermittent fillet welding shall be not less than four times the weld size, with a minimum of 1/2 in. (38 mm).

In lap joints, the minimum amount of lap shall be five times the thickness of the thinner part joined, but not less than 1 in. (25 mm). Lap joints joining plates or bars subjected to axial stress that utilize transverse fillet welds only shall be fillet welded along the end of both lapped parts, except where the deflection of the lapped parts is sufficiently restrained to prevent opening of the joint under maximum loading.

Fillet weld terminations are permitted to be stopped short or extend to the ends or sides of parts or be boxed except as limited by the following:

1. For overlapping elements of members in which one connected part extends beyond an edge of another connected part that is subject to calculated tensile stress, fillet welds shall terminate not less than the size of the weld from that edge.
2. For connections where flexibility of the outstanding elements is required, when end returns are used the length of the return shall not exceed four times the nominal size of the weld, or half the width of the part.
3. Fillet welds joining transverse stiffeners to plate girders - when the weld size is 1/8-in. (19 mm) thick or less shall end not less than four times nor more than six times the thickness of the web from the web toe of the web-to-flange welds, except where the ends of stiffeners are welded to the flange.
4. Fillet welds that occur on opposite sides of a common plane shall be interrupted at the corner common to both welds.

User Note: Fillet weld terminations should be located approximately one weld size from the edge of the connection to minimize notches in the base metal. Fillet welds terminated at the end of the joint, other than those connecting stiffeners to girders, are not a cause for correction.

Fillet welds in holes or slots are permitted to be used to transmit shear and resist loads perpendicular to the faying surface in lap joints or to prevent the buckling or
separation of lapped parts and to join components of built-up members. Such fillet welds may overlap, subject to the provisions of Section J2. Fillet welds in holes or slots are not to be considered plug or slot welds.

3. Plug and Slot Welds

3a. Effective Area

The effective shearing area of plug and slot welds shall be considered as the nominal cross-sectional area of the hole or slot in the plane of the faying surface.

3b. Limitations

Plug or slot welds are permitted to be used to transmit shear in lap joints or to prevent buckling or separation of lapped parts and to join component parts of built-up members.

The diameter of the holes for a plug weld shall not be less than the thickness of the part containing it plus \( \frac{3}{16} \) in. (8 mm), rounded to the next larger odd \( \frac{1}{16} \) in. (even mm), nor greater than the minimum diameter plus \( \frac{3}{8} \) in. (3 mm) or \( 2 \frac{1}{4} \) times the thickness of the weld.

The minimum center-to-center spacing of plug welds shall be four times the diameter of the hole.

The length of slot for a slot weld shall not exceed 10 times the thickness of the weld. The width of the slot shall be not less than the thickness of the part containing it plus \( \frac{3}{16} \) in. (8 mm) rounded to the next larger odd \( \frac{1}{16} \) in. (even mm), nor shall it be larger than \( 2 \frac{1}{4} \) times the thickness of the weld. The ends of the slot shall be semicircular or shall have the corners rounded to a radius of not less than the thickness of the part containing it, except those ends which extend to the edge of the part.

The minimum spacing of lines of slot welds in a direction transverse to their length shall be four times the width of the slot. The minimum center-to-center spacing in a longitudinal direction on any line shall be twice the length of the slot.

The thickness of plug or slot welds in material \( \frac{5}{8} \) in. (16 mm) or less in thickness shall be equal to the thickness of the material. In material over \( \frac{5}{8} \) in. (16 mm) thick, the thickness of the weld shall be at least one-half the thickness of the material but not less than \( \frac{5}{8} \) in. (16 mm).

4. Strength

The design strength, \( DR_n \), and the allowable strength, \( R_n/\Omega \), of welded joints shall be the lower value of the base material strength determined according to the limit states of tensile rupture and shear rupture and the weld metal strength determined according to the limit state of rupture as follows:

For the base metal

\[
R_n = F_{\theta \beta M} A_{BM}
\]

<sup>1</sup> For matching weld metal see AWS D1.1/D1.1M, Section 3.3.
<sup>2</sup> Filler metal with a strength level one strength level greater than matching is permitted.
<sup>3</sup> Filler metals with a strength level less than matching may be used for grooved welds between the webs and flanges of built-up sections transferring shear loads, or in applications where high restraint is a concern. In these applications, the weld joint shall be detailed and the weld shall be designed using the thickness of the material as the effective throat, where φ = 0.80, Ω = 1.88 and 0.60F<sub>EXX</sub> is the nominal strength.

Alternatively, the provisions of Section J2.4(a) are permitted provided the deformation compatibility of the various weld elements is considered. Sections J2.4(b) and (c) are special applications of Section J2.4(a) that provide for deformation compatibility.

For the weld metal

\[ R_a = F_{we} A_{we} \]  

(J2-3)

where

\[ F_{BM} = \text{nominal stress of the base metal, ksi (MPa)} \]
\[ F_{we} = \text{nominal stress of the weld metal, ksi (MPa)} \]
\[ A_{BM} = \text{cross-sectional area of the base metal, in}^2 \text{ (mm}^2\text{)} \]
\[ A_{we} = \text{effective area of the weld, in}^2 \text{ (mm}^2\text{)} \]

The values of φ, Ω, F<sub>BM</sub> and F<sub>we</sub> and limitations thereon are given in Table J2.5.

Alternatively, for fillet welds the available strength is permitted to be determined as follows:

\[ \phi = 0.75 \text{ (LRFD) } \Omega = 2.00 \text{ (ASD)} \]

(a) For a linear weld group with a uniform leg size, loaded through the center of gravity

\[ R_a = F_{we} A_{we} \]  

(J2-4)

where

\[ F_{we} = 0.60F_{EXX}(1.0 + 0.50 \sin^{1.5} \theta) \]  

(J2-5)

(b) For weld elements within a weld group that are analyzed using an instantaneous center of rotation method, the components of the nominal strength, R<sub>ex</sub> and R<sub>n</sub>, and the nominal moment capacity, M<sub>n</sub>, are permitted to be determined as follows:

\[ R_{ex} = \sum F_{we} A_{we} \]  

(J2-6a)

\[ R_{n} = \sum F_{we} A_{we} \]  

(J2-6b)

\[ M_n = \sum [F_{we} A_{we} (x_i - F_{we} A_{we} y_i)] \]  

(J2-7)

where

\[ A_{we} = \text{effective area of weld throat of the i}^{th} \text{ weld element, in}^2 \text{ (mm}^2\text{)} \]
\[ F_{we} = \text{nominal stress in the i}^{th} \text{ weld element, ksi (MPa)} \]
\[ F_{we} = \text{x-component of nominal stress, F}_{we,x} \text{ (ksi (MPa))} \]
\[ F_{we} = \text{y-component of nominal stress, F}_{we,y} \text{ (ksi (MPa))} \]
\[ p_{1i} = \Delta_i / \Delta_{crit}, \text{ ratio of element i deformation to its deformation at maximum stress} \]
\[ r_{cr} = \text{distance from instantaneous center of rotation to weld element with minimum } \Delta_{crit} / r, \text{ ratio, in. (mm)} \]
\[ r_{i} = \text{distance from instantaneous center of rotation to i}^{th} \text{ weld element, in. (mm)} \]
\[ x_{i} = \text{x component of } r_{i} \]
\[ y_{i} = \text{y component of } r_{i} \]
\[ \Delta_{crit} = r_{ill} / r_{cr} = \text{deformation of the i}^{th} \text{ weld element at an intermediate stress level, linearly proportioned to the critical deformation based on distance from the instantaneous center of rotation, } r_{cr}, \text{ in. (mm)} \]
\[ \Delta_{u} = 0.209(\theta_i + 2) \theta_i^{0.5} w, \text{ deformation of the i}^{th} \text{ weld element at maximum stress, in. (mm)} \]
\[ \Delta_{u} = 0.60F_{EXX}(1.0 + 0.50 \sin^{1.5} \theta) \]  

(j2-8)

\[ f_{p1}(p_1) = [p_1 (1.9 - 0.9 p_1)]^{1/3} \]  

(J2-9)

\[ p_{1i} = \Delta_i / \Delta_{crit}, \text{ ratio of element i deformation to its deformation at maximum stress} \]
\[ r_{cr} = \text{distance from instantaneous center of rotation to weld element with minimum } \Delta_{crit} / r, \text{ ratio, in. (mm)} \]
\[ r_{i} = \text{distance from instantaneous center of rotation to i}^{th} \text{ weld element, in. (mm)} \]
\[ x_{i} = \text{x component of } r_{i} \]
\[ y_{i} = \text{y component of } r_{i} \]
\[ \Delta_{crit} = r_{ill} / r_{cr} = \text{deformation of the i}^{th} \text{ weld element at an intermediate stress level, linearly proportioned to the critical deformation based on distance from the instantaneous center of rotation, } r_{cr}, \text{ in. (mm)} \]
\[ \Delta_{u} = 0.209(\theta_i + 2) \theta_i^{0.5} w, \text{ deformation of the i}^{th} \text{ weld element at maximum stress, in. (mm)} \]
\[ \theta_{ij} = \text{angle between the longitudinal axis of i}^{th} \text{ weld element and the direction of the result force acting on the element, degrees} \]

(c) For fillet weld groups concentrically loaded and consisting of elements with a uniform leg size that are oriented both longitudinally and transversely to the direction of applied load, the combined strength, R<sub>n</sub>, of the fillet weld group shall be determined as the greater of
are designed using the nominal strength and resistance factor or safety factor as applicable for a partial-joint-penetration groove weld.

(2) Complete-joint-penetration groove welded splices subject to tension normal to the effective area in heavy sections as defined in Sections A3.1c and A3.1d

The manufacturer’s Certificate of Conformance shall be sufficient evidence of compliance.

7. Mixed Weld Metal

When Charpy V-notch toughness is specified, the process consumables for all weld metal, tack welds, root pass and subsequent passes deposited in a joint shall be compatible to ensure notch-tough composite weld metal.

J3. BOLTS AND THREADED PARTS

1. High-Strength Bolts

Use of high-strength bolts shall conform to the provisions of the Specification for Structural Joints Using High-Strength Bolts, hereafter referred to as the RCSC Specification, as approved by the Research Council on Structural Connections, except as otherwise provided in this Specification. High-strength bolts in this Specification are grouped according to material strength as follows:

Group A—ASTM A325, A325M, F1852, A354 Grade BC, and A449

Group B—ASTM A490, A490M, F2280, and A354 Grade BD

When assembled, all joint surfaces, including those adjacent to the washers, shall be free of scale, except tight mill scale.

Bolts are permitted to be installed to the snug-tight condition when used in:

(a) bearing-type connections except as noted in Section E6 or Section J1.10

(b) tension or combined shear and tension applications, for Group A bolts only, where loosening or fatigue due to vibration or load fluctuations are not design considerations.

The snug-tight condition is defined as the tightness required to bring the connected plies into firm contact. Bolts to be tightened to a condition other than snug tight shall be clearly identified on the design drawings.

All high-strength bolts specified on the design drawings to be used in pretensioned or slip-critical joints shall be tightened to a bolt tension not less than that given in Table J3.1 or J3.1M. Installation shall be by any of the following methods: turn-of-nut method, a direct-tension-indicator, twist-off-type tension-control bolt, calibrated wrench, or alternative design bolt.

User Note: There are no specific minimum or maximum tension requirements for snug-tight bolts. Fully pretensioned bolts such as ASTM F1852 or F2280 are permitted unless specifically prohibited on design drawings.

User Note: The following User Note Table summarizes the AWS D1.1/D1.1M provisions for matching filler metals. Other restrictions exist. For a complete list of base metals and prequalified matching filler metals see AWS D1.1/D1.1M, Table 3.1.

<table>

</tbody>
</table>

*For corrosion resistance and color similar to the base metal, see AWS D1.1/D1.1M, subclause 3.7.3.

Notes:

Filler metals must meet the requirements of AWS A5.1, A5.5, A5.17, A5.18, A5.20, A5.23, A5.28 or A5.29.

In joints with base metals of different strengths, use either a filler metal that matches the higher strength base metal or a filler metal that matches the lower strength and produces a low hydrogen deposit.

Filler metal with a specified minimum Charpy V-notch toughness of 20 ft-lb (27 J) at 40 °F (4 °C) or lower shall be used in the following joints:

(1) Complete-joint-penetration groove welded T- and corner joints with steel backing left in place, subject to tension normal to the effective area, unless the joints

*Equal to 0.70 times the minimum tensile strength of bolts, rounded off to nearest kN, as specified in ASTM specifications for A325M and A490M bolts with UNC threads.

When bolt requirements cannot be provided within the RCSC Specification limitations because of requirements for lengths exceeding 12 diameters or diameters exceeding 1 1/2 in. (38 mm), bolts or threaded rods conforming to Group A or Group B materials are permitted to be used in accordance with the provisions for threaded parts in Table J3.2.

When ASTM A354 Grade BC, A354 Grade BD, or A449 bolts and threaded rods are used in slip-critical connections, the bolt geometry including the thread pitch, thread length, head, and nut(s) shall be equal to or (if larger in diameter) proportional to that required by the RCSC Specification. Installation shall comply with all applicable requirements of the RCSC Specification with modifications as required for the increased diameter and/or length to provide the design pretension.

<td>84 (579)</td>
</tr>
</tbody>
</table>

$^{[a]}$ Threads permitted in shear planes.

$^{[b]}$ For high-strength bolts subject to tensile fatigue loading, see Appendix 3.

$^{[c]}$ For high-strength bolts subject to high-strength bolts subject to end loading connections with a fastener pattern length greater than 38 in. (965 mm), $F_{uv}$ shall be reduced to 83.3% of the tabulated values. Fastener pattern length is the maximum distance parallel to the line of force between the centers of the bolts connecting two parts with one faying surface.

$^{[d]}$ For A307 bolts the tabulated values shall be reduced by 1% for each 1/16 in. (2 mm) over 5 diameters of length in the grip.

2. Size and Use of Holes

The maximum sizes of holes for bolts are given in Table J3.3 or Table J3.3M, except that larger holes, required for tolerance on location of anchor rods in concrete foundations, are permitted in column base details.

Standard holes or short-slotted holes transverse to the direction of the load shall be provided in accordance with the provisions of this specification, unless oversized holes, short-slotted holes parallel to the load, or long-slotted holes are approved...
When Group B bolts over 1 in. (25 mm) in diameter are used in slotted or oversized holes in external plies, a single hardened washer conforming to ASTM F436, except with 5/16-in. (8 mm) minimum thickness, shall be used in lieu of the standard washer.

User Note: Washer requirements are provided in the RCSC Specification, Section 6.

Long-slotted holes are permitted in only one of the connected parts of either a slip-critical or bearing-type connection at an individual faying surface. Long-slotted holes are permitted without regard to direction of loading in slip-critical connections, but shall be normal to the direction of load in bearing-type connections. Where long-slotted holes are used in an outer ply, plate washers, or a continuous bar with standard holes, having a size sufficient to completely cover the slot after installation, shall be provided. In high-strength bolted connections, such plate washers or continuous bars shall be not less than 5/16-in. (8 mm) thick and shall be of structural grade material, but need not be hardened. If hardened washers are required for use of high-strength bolts, the hardened washers shall be placed over the outer surface of the plate washer or bar.

3. Minimum Spacing

The distance between centers of standard, oversized or slotted holes shall not be less than 2\(\sqrt{d}\) times the nominal diameter, where the distance of a fastener or a distance of 3\(\sqrt{d}\) is preferred.

User Note: ASTM F1554 anchor rods may be furnished in accordance to product specifications with a body diameter less than the nominal diameter. Load effects such as bending and elongation should be calculated based on minimum diameters permitted by the product specification. See ASTM F1554 and the table, “Applicable ASTM Specifications for Various Types of Structural Fasteners,” in Part 2 of the AISC Steel Construction Manual.

4. Minimum Edge Distance

The distance from the center of a standard hole to an edge of a connected part in any direction shall not be less than either the applicable value from Table J3.4 or Table J3.4M, or as required in Section J3.10. The distance from the center of an oversized or slotted hole to an edge of a connected part shall be not less than that required for a standard hole to an edge of a connected part plus the applicable increment, \(C_2\), from Table J3.5 or Table J3.5M.

User Note: The edge distances in Tables J3.4 and J3.4M are minimum edge distances based on standard fabrication practices and workmanship tolerances. The appropriate provisions of Sections J3.10 and J4 must be satisfied.

5. Maximum Spacing and Edge Distance

The maximum distance from the center of any bolt to the nearest edge of parts in contact shall be 12 times the thickness of the connected part under consideration.

4\(\times\) Clearance provided allows the use of a 1-in. bolt if desirable.

---

by the engineer of record. Finger shims up to 1/4 in. (6 mm) are permitted in slip-critical connections designed on the basis of standard holes without reducing the nominal shear strength of the fastener to that specified for slotted holes.

Oversized holes are permitted in any or all plies of slip-critical connections, but they shall not be used in bearing-type connections. Hardened washers shall be installed over oversized holes in an outer ply.

Short-slotted holes are permitted in any or all plies of slip-critical or bearing-type connections. The slots are permitted without regard to direction of loading in slip-critical connections, but the length shall be normal to the direction of the load in bearing-type connections. Washers shall be installed over short-slotted holes in an outer ply; when high-strength bolts are used, such washers shall be hardened washers conforming to ASTM F436.

<tr>
<td>( \geq 27 )</td>
<td>3</td>
<td>5</td>
</tr>
</tbody>
</table>

When length of slot is less than maximum allowable (see Table J3.3M), \( C_2 \) is permitted to be reduced by one-half the difference between the maximum and actual slot lengths.

but shall not exceed 6 in. (150 mm). The longitudinal spacing of fasteners between elements consisting of a plate and a shape or two plates in continuous contact shall be as follows:

(a) For painted members or unpainted members not subject to corrosion, the spacing shall not exceed 24 times the thickness of the thinner part or 12 in. (305 mm).

(b) For unpainted members of weathering steel subject to atmospheric corrosion, the spacing shall not exceed 14 times the thickness of the thinner part or 7 in. (180 mm).

User Note: Dimensions in (a) and (b) do not apply to elements consisting of two shapes in continuous contact.
6. Tensile and Shear Strength of Bolts and Threaded Parts

The design tensile or shear strength, \( \phi R_n \), and the allowable tensile or shear strength, \( R_{nt} \), of a snug-tightened or pretensioned high-strength bolt or threaded part shall be determined according to the limit states of tension rupture and shear rupture as follows:

\[
R_n = F_n A_b \\
\phi = 0.75 \text{ (LRFD)} \quad \Omega = 2.00 \text{ (ASD)}
\]

where

\( A_b \) = nominal unthreaded body area of bolt or threaded part, in.\(^2\) (mm\(^2\))
\( F_n \) = nominal tensile stress, \( F_{nt} \) or shear stress, \( F_{nv} \), from Table J3.2, ksi (MPa)

The required tensile strength shall include any tension resulting from prying action produced by deformation of the connected parts.

**User Note:** The force that can be resisted by a snug-tightened or pretensioned high-strength bolt or threaded part may be limited by the bearing strength at the bolt hole per Section J3.10. The effective strength of an individual fastener may be taken as the lesser of the fastener shear strength per Section J3.6 or the bearing strength at the bolt hole per Section J3.10. The strength of the bolt group is taken as the sum of the effective strengths of the individual fasteners.

7. Combined Tension and Shear in Bearing-Type Connections

The available tensile strength of a bolt subjected to combined tension and shear shall be determined according to the limit states of tension and shear rupture as follows:

\[
R_n = F'_{nt} A_b \\
\phi = 0.75 \text{ (LRFD)} \quad \Omega = 2.00 \text{ (ASD)}
\]

where

\( F'_{nt} \) = nominal tensile stress modified to include the effects of shear stress, ksi (MPa)

\[
F'_{nt} = 1.3 F_{nt} - \frac{F_{nt}}{\phi} f_r \leq F_{nt} \text{ (LRFD)} \tag{J3-3a}
\]

\[
F'_{nt} = 1.3 F_{nt} - \frac{\Omega F_{nv}}{f_r} f_r \leq F_{nt} \text{ (ASD)} \tag{J3-3b}
\]

\( F_{nt} \) = nominal tensile stress from Table J3.2, ksi (MPa)
\( F_{nv} \) = nominal shear stress from Table J3.2, ksi (MPa)
\( f_r \) = required shear stress using LRFD or ASD load combinations, ksi (MPa)

The available shear stress of the fastener shall equal or exceed the required shear stress, \( f_r \).

8. High-Strength Bolts in Slip-Critical Connections

Slip-critical connections shall be designed to prevent slip and for the limit states of bearing-type connections. When slip-critical bolts pass through fillers, all surfaces subject to slip shall be prepared to achieve design slip resistance.

The available slip resistance for the limit state of slip shall be determined as follows:

\[
R_n = \mu D h_f T_h n_x
\]

(a) For standard size and short-slotted holes perpendicular to the direction of the load

\[
\phi = 1.00 \text{ (LRFD)} \quad \Omega = 1.50 \text{ (ASD)}
\]

(b) For oversized and short-slotted holes parallel to the direction of the load

\[
\phi = 0.85 \text{ (LRFD)} \quad \Omega = 1.76 \text{ (ASD)}
\]

(c) For long-slotted holes

\[
\phi = 0.70 \text{ (LRFD)} \quad \Omega = 2.14 \text{ (ASD)}
\]

where

\( \mu \) = mean slip coefficient for Class A or B surfaces, as applicable, and determined as follows, or as established by tests:

(i) For Class A surfaces (unpainted clean mill scale steel surfaces or surfaces with Class A coatings on blast-cleaned steel or hot-dipped galvanized and roughened surfaces)

\[ \mu = 0.30 \]

(ii) For Class B surfaces (unpainted blast-cleaned steel surfaces or surfaces with Class B coatings on blast-cleaned steel)

\[ \mu = 0.50 \]

\( D_h = 1.13 \), a multiplier that reflects the ratio of the mean installed bolt pretension to the specified minimum bolt pretension. The use of other values may be approved by the engineer of record.

\( T_h = \) minimum fastener tension given in Table J3.1, kips, or Table J3.1M, kN

\( h_f = \) factor for fillers, determined as follows:

(i) Where there are no fillers or where bolts have been added to distribute loads in the filler

\[ h_f = 1.0 \]
(ii) Where bolts have not been added to distribute the load in the filler:

(a) For one filler between connected parts

\[ h_f = 1.0 \]

(b) For two or more fillers between connected parts

\[ h_f = 0.85 \]

\[ n_s = \text{number of slip planes required to permit the connection to slip} \]

9. Combined Tension and Shear in Slip-Critical Connections

When a slip-critical connection is subjected to an applied tension that reduces the net clamping force, the available slip resistance per bolt, from Section J3.8, shall be multiplied by the factor, \( k_{sc} \), as follows:

\[ k_{sc} = \frac{T_a}{T_u} \quad \text{(LRFD)} \]

\[ k_{sc} = \frac{T_a}{1.5T_u} \quad \text{(ASD)} \]

where

\[ T_a = \text{required tension force using ASD load combinations, kips (kN)} \]
\[ T_u = \text{required tension force using LRFD load combinations, kips (kN)} \]
\[ n_b = \text{number of bolts carrying the applied tension} \]

10. Bearing Strength at Bolt Holes

The available bearing strength, \( \phi R_n \) and \( R_n/\Omega \), at bolt holes shall be determined for the limit state of bearing as follows:

\[ \phi = 0.75 \quad \text{(LRFD)} \]
\[ \Omega = 2.00 \quad \text{(ASD)} \]

The nominal bearing strength of the connected material, \( R_n \), is determined as follows:

(a) For a bolt in a connection with standard, oversized and short-slotted holes, independent of the direction of loading, or a long-slotted hole with the slot parallel to the direction of force

(i) When deformation at the bolt hole at service load is a design consideration

\[ R_n = 1.2l_t F_u \leq 2.4dt F_u \quad \text{(J3-6a)} \]

(ii) When deformation at the bolt hole at service load is not a design consideration

\[ R_n = 1.5l_t F_u \leq 3.0dt F_u \quad \text{(J3-6b)} \]

(b) For a bolt in a connection with long-slotted holes with the slot perpendicular to the direction of force

\[ R_n = 1.0l_t F_u \leq 2.0dt F_u \quad \text{(J3-6c)} \]

(c) For connections made using bolts that pass completely through an unstiffened box member or HSS, see Section J7 and Equation J7-1;

where

\[ F_u = \text{specified minimum tensile strength of the connected material, ksi (MPa)} \]
\[ d = \text{nominal bolt diameter, in. (mm)} \]
\[ l_c = \text{clear distance, in the direction of the force, between the edge of the hole and the edge of the adjacent hole or edge of the material, in. (mm)} \]
\[ t = \text{thickness of connected material, in. (mm)} \]

For connections, the bearing resistance shall be taken as the sum of the bearing resistances of the individual bolts.

Bearing strength shall be checked for both bearing-type and slip-critical connections. The use of oversized holes and short- and long-slotted holes parallel to the line of force is restricted to slip-critical connections per Section J3.2.

User Note: The effective strength of an individual fastener is the lesser of the fastener shear strength per Section J3.6 or the bearing strength at the bolt hole per Section J3.10. The strength of the bolt group is the sum of the effective strengths of the individual fasteners.

11. Special Fasteners

The nominal strength of special fasteners other than the bolts presented in Table J3.2 shall be verified by tests.

12. Tension Fasteners

When bolts or other fasteners in tension are attached to an unstiffened box or HSS wall, the strength of the wall shall be determined by rational analysis.

J4. AFFECTED ELEMENTS OF MEMBERS AND CONNECTING ELEMENTS

This section applies to elements of members at connections and connecting elements, such as plates, gussets, angles and brackets.

1. Strength of Elements in Tension

The design strength, \( \phi R_{re} \), and the allowable strength, \( R_e/\Omega \), of affected and connecting elements loaded in tension shall be the lower value obtained according to the limit states of tensile yielding and tensile rupture.

(a) For tensile yielding of connecting elements

\[ R_e = F_y A_e \quad \text{(J4-1)} \]
\[ \phi = 0.90 \quad \text{(LRFD)} \quad \Omega = 1.67 \quad \text{(ASD)} \]

(b) For tensile rupture of connecting elements

\[ R_e = F_u A_e \quad \text{(J4-2)} \]
\[ \phi = 0.75 \text{ (LRFD)} \quad \Omega = 2.00 \text{ (ASD)} \]

where

\[ A_e = \text{effective net area as defined in Section D3, in.}^2 \text{ (mm}^2) \]; for bolted splice plates, \( A_e = A_{gb} \leq 0.85 A_g \).

**User Note:** The effective net area of the connection plate may be limited due to stress distribution as calculated by methods such as the Whitmore section.

2. **Strength of Elements in Shear**

The available shear strength of affected and connecting elements in shear shall be the lower value obtained according to the **limit states** of shear yielding and shear rupture:

(a) For shear yielding of the element:

\[ R_u = 0.60 F_y A_{gy} \quad \text{(J4-3)} \]

\[ \phi = 1.00 \text{ (LRFD)} \quad \Omega = 1.50 \text{ (ASD)} \]

where

\[ A_{gy} = \text{gross area subject to shear, in.}^2 \text{ (mm}^2) \]

(b) For shear rupture of the element:

\[ R_u = 0.60 F_u A_{uy} \quad \text{(J4-4)} \]

\[ \phi = 0.75 \text{ (LRFD)} \quad \Omega = 2.00 \text{ (ASD)} \]

where

\[ A_{uy} = \text{net area subject to shear, in.}^2 \text{ (mm}^2) \]

3. **Block Shear Strength**

The **available strength** for the **limit state of block shear rupture** along a shear failure path or paths and a perpendicular tension failure path shall be taken as

\[ R_u = 0.60 F_u A_{uy} + U_{bt} F_y A_{oy} \leq 0.60 F_y A_{oy} + U_{bt} F_y A_{ot} \quad \text{(J4-5)} \]

\[ \phi = 0.75 \text{ (LRFD)} \quad \Omega = 2.00 \text{ (ASD)} \]

where

\[ A_{ot} = \text{net area subject to tension, in.}^2 \text{ (mm}^2) \]

Where the tension stress is uniform, \( U_{bt} = 1 \); where the tension stress is nonuniform, \( U_{bt} = 0.5 \).

**User Note:** Typical cases where \( U_{bt} \) should be taken equal to 0.5 are illustrated in the Commentary.

4. **Strength of Elements in Compression**

The **available strength** of connecting elements in compression for the **limit states** of yielding and buckling shall be determined as follows:

(a) When \( KL/r \leq 25 \)

\[ P_n = F_y A_g \quad \text{(J4-6)} \]

\[ \phi = 0.90 \text{ (LRFD)} \quad \Omega = 1.67 \text{ (ASD)} \]

(b) When \( KL/r > 25 \), the provisions of Chapter E apply.

5. **Strength of Elements in Flexure**

The available flexural strength of affected elements shall be the lower value obtained according to the **limit states** of flexural yielding, local buckling, flexural lateral-torsional buckling and flexural rupture.

J5. **FILLERS**

1. **Fillers in Welded Connections**

Whenever it is necessary to use **fillers** in joints required to transfer applied force, the fillers and the connecting welds shall conform to the requirements of Section J5.1a or Section J5.1b, as applicable.

1a. **Thin Fillers**

**Fillers** less than \( \frac{1}{4} \text{ in.} \text{ (6 mm)} \) thick shall not be used to transfer stress. When the thickness of the fillers is less than \( \frac{1}{4} \text{ in.} \text{ (6 mm)} \), or when the thickness of the filler is \( \frac{1}{4} \text{ in.} \text{ (6 mm)} \) or greater but not adequate to transfer the applied force between the connected parts, the filler shall be kept flush with the edge of the outside connected part, and the size of the weld shall be increased over the required size by an amount equal to the thickness of the filler.

1b. **Thick Fillers**

When the thickness of the **fillers** is adequate to transfer the applied force between the connected parts, the filler shall extend beyond the edges of the outside connected base metal. The welds joining the outside connected base metal to the filler shall be sufficient to transmit the force to the filler and the area subjected to the applied force in the filler shall be adequate to avoid overstressing the filler. The welds joining the filler to the inside connected base metal shall be adequate to transmit the applied force.

2. **Fillers in Bolted Connections**

When a bolt that carries load passes through **fillers** that are equal to or less than \( \frac{1}{4} \text{ in.} \text{ (6 mm)} \) thick, the shear strength shall be used without reduction. When a bolt that carries load passes through fillers that are greater than \( \frac{1}{4} \text{ in.} \text{ (6 mm)} \) thick, one of the following requirements shall apply:

(a) The shear strength of the bolts shall be multiplied by the factor

\[ 1 - 0.4(t - 0.25) \]

\[ \text{[S.I.: } 1 - 0.0154(t - 6) \text{]} \]

but not less than 0.85, where \( t \) is the total thickness of the fillers;
